

The Analyze Tab

If you are selling next 30 days calls or puts. This tab searches the next 30 days of Calls and Puts and finds the “best” one to trade. Best being risk of not getting assigned, able to capture 60% of the premium. For price prediction Chalkin Money Flow is being used.

The Scheduled Job Tab

Scheduled jobs are the same logic as the Analyze tab, but provide a history of the options action as they run at 9 am and 11 am for a select set of stocks.

Daychart

The Daychart is supposed to provide a chart that has look ahead price by up to 30 minutes. I have found the 15 minute price action to show the best indication. The look ahead price uses Chalkin Money Flow for price prediction.

For TSLA intra day trading I found that most days TSLA and NVDA trade in sync probably due to program trading. Right now it gives a data in a table form.
